

## Relation between density of *Phalaris minor* and broadleaf weeds with respect to the Grain Yield of crop

### Results

#### *Correlation of weed density with grain yield*

A strong negative correlation between grain yield and weed density was evident in the study. The higher grain yield was mainly due to the broad-spectrum weed control provided by herbicide combinations, which tilted competition in favor of the crop. *Phalaris minor* caused 86.4 and 86.3% variation in grain yield in 2021-22 and 2022-23. During the growing seasons of 2021-22 and 2022-23, the density of broadleaf weeds significantly influenced wheat grain yield, explaining 85.6 and 85.8% of variance, respectively (Table 1, Fig. 1).

There was strong negative correlation of grain yield of wheat with density of *P. minor* weeds, with  $R^2$  of 0.864 and 0.863 during 2021-22 and 2022-23, respectively. The regression equations were as below –

$$Y = - 88.555 X + 6647.4 \text{ (2021-22)}$$

$$Y = - 84.479 X + 6761.8 \text{ (2022-23)}$$

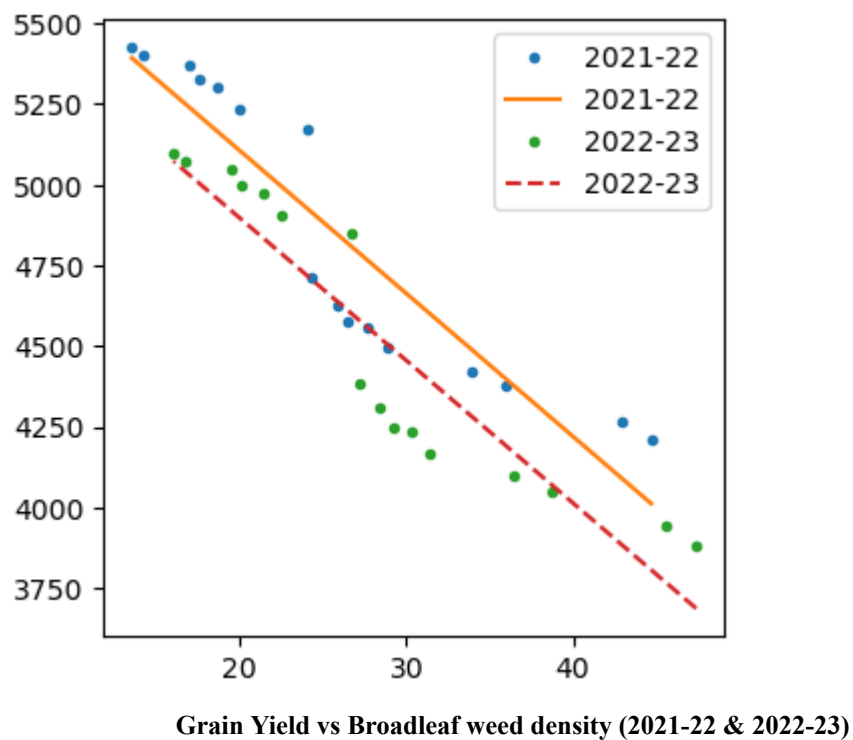

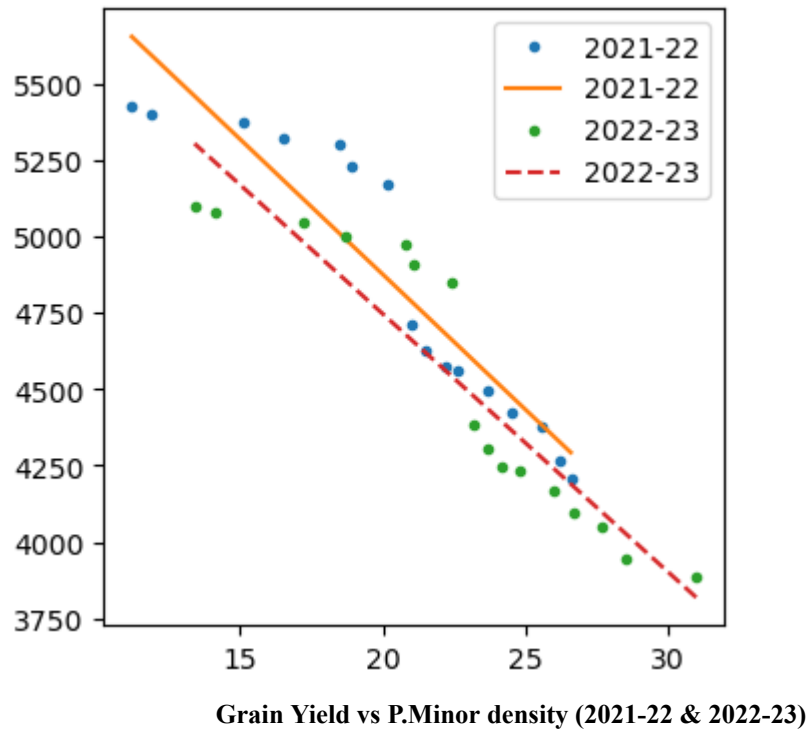

Similarly,  $R^2$  for correlation between grain yield of wheat with density of broadleaf weeds was 0.856 and 0.857 during 2021-22 and 2022-23, respectively. The regression equations were as below –

$$Y = - 44.296 X + 5951.5 \text{ (2021-22)}$$

$$Y = - 44.119 X + 6103.5 \text{ (2022-23)}$$

**Table 1.** Effect of metribuzin MTZ) doses, time and method of application on density of *Phalaris minor* and broadleaf weeds (BLW) (No. m<sup>-2</sup>) in wheat at 90 DAS and grain yield of zero tillage wheat under residue retention

Treatment	Time of application	<i>Phalaris minor</i> (No. m <sup>-2</sup> )		Broadleaf weeds (No. m <sup>-2</sup> )		Grain yield of wheat (kg ha <sup>-1</sup> )	
		2021-22	2022-23	2021-22	2022-23	2021-22	2022-23
MTZ-210 spray	PRE	26.6	31.0	44.7	47.4	4,209	3,884
